----------------------------------------------------------------------------------------------------------

## FUNK ME STRING

- strtolower -> texti met vogla
p.s strtolower($name) e $name='ShpE'; pra lexoje
variablen name merri kejt met vogla

-str_word_count-> sa fjal i ka texti
$string='this is a string';
$string_count=str_word_count($string);//sa eshte nr
i fjal jan brenda 1 stringu REZ:4
echo $string_count;

-strlen-> gjatsia e textit
//perdoret gjat validimit te formave
$string='this is a string';
echo strlen($string);//REZ :16-gjatsine e stringut

-str_shuffle-> perzi textin
$string='this is a string';
$string_count=str_shuffle($string);
echo $string_count;//e ben perzirjen random te stringut

-strrev-> me kthy mbrapa textin
$string='this is a string';
echo strrev($string);//e kthen mbrapa stringun

-similar_text-> ngjajshmeria e textit ne perqindje me vlere prej 0-100
$string1='this is a string';
$string2='this is a string about php';
similar_text($string1,$string2,$a);//sa % kan ngjashmeri
textet brenda variablave edhe qajo perqindje ruhet tek argumenti
i tret phiii legjend po shkruj pa e kshyr tasteren great.
echo $a;

**-str_replace->** me zevendsu naj pjes te stringut me naj pjese tjeter

```
$str1='The cate is than better dog';
$str2='bird';
$str3=str_replace('cate',$str2,$str1);//tek variabla $str1 fjala
```
cate zevendsohet me variablen e dyt $str2 rradhitja e argumentev
ne funksion behet siq eshte paraqitur.
```
echo $str3;
```

**-substr_replace->** me zevendsu textin brenda stringut

```
$var1='hello world per ty sabit';
$var2='shpend';
$var3=substr_replace($var1,$var2,6,5);//argumenti i par osht ku don me bo ndrrimin ne
```
cilin string, i dyti me qfar stringu don me bo ndrrimin, i treti prej cilit vend pra prej ciles
pozit don me fillu ndrrimi edhe i katerti sa karaktere te argumentit te par per ket
rast$var1 don mi zevendsu pra 5 karaktere qe i bjen veq fjalen world
```
echo $var3;//REZ: hello shpend per ty sabit.
```

**-strpos->** me gjet se ne cilen pozit fillon teksti i kerkuar brenda 1 stgringu

```
$find='is';
$find_length=strlen($find);
$string='this is a boy';
echo strpos($string,$find,3);//argumenti i 1
```
//osht ne cilin string me bo kerkimin, argumenti
//i dyte osht qka me kerku, edhe argumenti
//trete osht prej ciles pozit mja fillu kerkimin

**-substr->**

```
substr(string, start);
```
//argumenti i pare osht ne cilin string mirret teksti ne cilen variabel ka me vepru
//funksioni
//argumenti I dyte tregon prej ciles pozite (indeks) ka mu marr teksti
```
$stringu='blla-BLLA'
substr($stringu, 5);     rez:      BLLA
```

ucfirst($n1);
$n1=blla;

      nese e shtypum ucfirst($n1); fitojm rez: Blla

pra ky funksion e bon vetem shkronjen e par te madhe pra b ne B. tjerat si interesojn i len qysh jon. mpuqq kiss kiss bye bye.

----------------------------------------------------------------------------------------------------

## *FOREACH*

```
$food=array('Fast Food SABITI'=>
                        array('pizza','burek','pesqe'),
                'Gjelltore TE NAZI'=>
                        array('pasul','gullash'));
foreach($food as $element=>$inner_array)
{
        echo '<strong>'.$element.'</strong><br>';
        foreach($inner_array as $item )
        echo $item.'<br>';
}
```

Foreach perdoret gati njejt si nje unaz for por kur nuk e dim se sa ka mu kon kushti p.s i<?

Nuk e dim deri ku ka me shku unza per sa antar ka mu perserit ajo unaz

p.s nese jem tu regjistru emra ne nje fajll edhe I thojm qe tan kohen mi lexu ata emra e perdorim foreach.

----------------------------------------------------------------------------------------------------

## INCLUDE

```
//Pse bash mu perdor kjo forja, osht qe ne qdo faqe qe bohet me
permbajt header, footerin, aside etj etj te njejta edhe veq per-
mbajtjen e bodyit me ndrru that'it point besoj qe e kom shkru
mir qat fjalen that'it po edhe qe se kom shkru kujt pi han hyhy

P.S EMRIN E FAJLLIT QE PO DON ME PERFSHI
INCLUDE 'PERFSHIJE.PHP';
```

```php
<?php //first.php

        include 'header.inc.php';
        echo $a;
?>
```

---------------------------------------------------

```php
<?php //anotherPage.php
        include 'header.inc.php';
        echo $b;

?>
```
---------------------------------------------------

```php
        // heager.inc.php
<h1>Shpendi's Website</h1>
<?php
        $a='string';
        $b=10;

?>
```

-----------------------------------------------------------------------------------------------------------------

```php
$time =time();
$actual_time= date('d m Y-H:i:s',time());/*argumenti
i par eshte per oren nese osht me shkronj te
vogel e tregon oren prej 00-11 e nese osht me
shkronje te madhe e tregon prej 00-24
argumenti i dyt minutat edhe i treti secondat
mes shkronjav H:i:s mujm me vendos qfardo kara-
ktre qe dojm p.s H-i-s
parametrat D m Y e tregojn diten mujin dhe vitin*/
echo $actual_time;
```
-----------------------------------------------
**menyra tjeter:**
```php
$time=time()+135;
echo time().'<br>';
```

echo $time;

------------------------------------------------

-strtotime-> me ndyshu kohen
strtotime('-1 week 2 hours 3 minutes 30 seconds');
// me - shkon mbrapa ne koh me + para.

$time =time();
$time_now=date('d M Y--H:i:s',$time);
$time_modified=date('d M Y--H:i:s',
    strtotime('-1 week 2 hours 3 minutes 30 seconds'));
echo 'time now : '. $time_now.'<br>'.' time modified : '.$time_modified;

-------------------------------------------------------------------------------------------------------------

# Random Numbers

$rand=rand(0,20);//pra argumenti I par tregon prej kujt mja fillu me i perserit nr e deri ku, deri me 10 shifra po shkon sdi ma shum qa bohet fati I ti.

# $_SERVER Variables

-------------------------------------------------------------------------------------------------------------

prova.php

```php
<?php
include 'header.inc.php';
if(isset($_POST['submit']))
{
    echo 'proces 1';
}
?>
```

-------------------------------------------------------------------------------------------------------------

header.inc.php

```php
<?php
```

```php
$var=$_SERVER['SCRIPT_NAME'];
?>
<form action="<?php echo $var;?>" method="POST">
        <input type="submit" name="submit" values="submit">
</form>//pra forja e qasaj osht qe me ndryshu ne menyr dinamike shtegun e fajllit kushtimisht
Nese kish me kon p.s prova.php kur ishem kon ne anotherpage.php edhe kishem kliku mbi
butonin submit action="prova.php" edhe automatikisht ish llodu faqja e prova.php.
```
--------------------------------------------------------------------------------------------------------------------

        anotherpage.php
```php
<?php
include 'header.inc.php';
if(isset($_POST['submit']))
{
        echo 'proces 2';
}
?>
```
--------------------------------------------------------------------------------------------------------------------

&lt;input type="<u>**submit**</u>" /&gt; defines a submit button.

A submit button is used to send form data to a server. The data is sent to the page specified in the form's action attribute. The file defined in the action attribute usually does something with the received input:

--------------------------------------------------------------------------------------------------------------------

# header();

```php
<?php ob_start();?>//I jep perparsi per mu ekzekutu kodit ne php dhe nuk ekzekutohet fare
kodi html
```

```html
<h1>My web page</h1>
```

```php
<?php
$redirect=true;
if($redirect==true)
{
        header('Location:http://google.co.uk');
        //header te drejton tek linku
}
ob_end_flush();//nese ndodh qe tmos mund te shkojm tek linku ather ekzekutohet pjesa e
kodit html pra nese ndo ku I ndryshon vlera $redirect=true;  I behet false.
?>
```
--------------------------------------------------------------------------------------------------------------------------

# $_SERVER['REMOTE_ADDR']

```php
<?php
//include conf.inc.php;
$ip_address=$_SERVER['REMOTE_ADDR'];//e merr IP addressen qe I qaset.
$ip_bllocked=array('127.0.0.1','100.100.100.100');
foreach ($ip_bllocked as $ip ) {
        if ($ip==$ip_addres) {
                die('Your IP address has ben blocked');
        }
}
?>
```

```html
<h1>wellcome</h1>
```
--------------------------------------------------------------------------------------------------------------------------

# Mos me leju me shtyp skripta

```php
<?php
if(isset($_GET['text']))
{
        $var=htmlentities($_GET["text"]);
        if(!empty($var))
```

```php
        {
                echo $var;
        }

}
?>
<form action="index.php" method="GET">
        <input type="text" name="text">
        <input type ="submit" name="submit" value="Submit">
</form>
```

-------------------------------------------------------------------------------------------------------------------

## Funksioni Define

```php
define("Cmimi_PC",750);
define("Cmimi_Printer", 125.5);
define("Cmimi_HD", 75.05);
//define("Cmimi_PC",25); //nuk mund të ndërrohet vlera e konstantës Cmimi_PC pra variabla
//Cmimi_PC eshte variable konstante. Si ne c++ const int a=5;
echo "PC ". Cmimi_PC ."<br />";
echo "Printer ". Cmimi_Printer ."<br />";
echo "HD ". Cmimi_HD ."<br />";
echo Cmimi_PC+Cmimi_HD;//thjesht mi perdor variablat pa e perdor shenjen e $(dollarit).
//edhe kto variabla kan vlera kontante.
/*Cmimi_PC=Cmimi_PC+Cmimi_HD;
echo 'qmimi pc'.Cmimi_PC;
```

-------------------------------------------------------------------------------------------------------------------

## SESSION

Fajlli 1:  set.php
```php
<?php
session_start();

$_SESSION['username']='alex';
$_SESSION['age']=21;
?>
```

-------------------------------------------------------------------------------------------------------------------

Fajlli 2:  view.php
```php
<?php
```

```php
session_start();
        echo 'wellcome '.$_SESSION['username'].'you are '.$_SESSION['age'];
?>
```
-----------------------------------------------------------------------------------------------------------------

        Fajlli 3: unset.php
```php
<?php
session_start();
//unset($_SESSION['username']);//e ndalon vetem ket variabel te sesionit.
session_destroy();
//e ndalon ter sesionin.
?>
```

-----------------------------------------------------------------------------------------------------------------

# <mark>COOKIE</mark>

        Fajlii 1: set.php
```php
<?php /*zakonisht perdoret kur don mja caktu kohen deri sa mu kon valide naj faqe ose diqka
te ngjashme */
setcookie('username','alex',time()+30);
//argumenti i par osht emri i cookie-t i dyti qfar permban edhe i 3 kohen deri sa ka me vlejt
//cookie.

if (isset($_POST['txt'])) {
        $a=$_POST['txt'];
        if (!empty($a)) {
        $b=fopen('names.txt','a');
                fwrite($b,$a."\n");
```

```php
            fclose($b);

            $d=1;
            echo 'Current names in file: ';
            $c=file('names.txt');
            $c_count=count($c);//me ket funk e shohim qe te dhenat ne fajll ruhen si array
si antar te vektorit
            foreach ($c as $fname) {
                    echo trim($fname);
                    if($d<$c_count){
                            echo ', ';
                            $d++;
                    }
            }
        }
    else{
        echo 'koneksioni u mbyll';
    }
}
        ?>
```

### Menyra tjeter qysh me lexu prej fajllit

```php
<?php
$a='names.txt';
$handle=fopen($a,'r');
echo fread($handle,filesize($a));//argumenti i dyt thot per ter gjatsin e fajllit munet mu kon p.s
//100 qe i merr 100 bitat e par te fajllit
?>
```
--------------------------------------------------------------------------------------------------------------------
```php
<?php
$filename='filetorename.txt';
if (file_exists($filename)) {//funk qe kerkon nese egziston fajlli $filename
    echo 'File already exist.';
}
else
{
    $handle=fopen($filename, 'a');
    fwrite($handle,'Nothing.');
    fclose($handle);
```

```php
}
?>
```

---

```php
<?php
$filename='filetodelete.txt';
if (unlink($filename)) {//funk qe  ben fshirjen e fajllit
        echo 'Faile <strong>'.$filename.'</strong> has been deleted';
} else {
        echo 'File cannot be deleted';
}
?>
```

---

```php
<?php
$filename='filetorename.txt';
rename($filename,'fajlliri.php');
//funksioni per mja ndrru emrin si dhe formatin e fajllit.
?>
```

---

## Kontrolla e Re File

```php
<?php
$name=$_FILES['pldh']['name'];//tregon emrin e fajllit
$size=$_FILES['pldh']['size'];//madhsine
$type=$_FILES['pldh']['type'];//tipin
$temporary_name=$_FILES['pldh']['tmp_name'];//direktoriumin e fajllit
?>
```

ska bo te une.

```php
<form action="up.php" method="POST" enctype="multipart/from-data">
        <input type="file" name="pldh"><br><br>
        <input type="submit" value="submit">
</form>//bon po fajet I ka pas xampi kejt o ok me ket Cod *shenim I me vonshem*
```

---

# KLASAT ne PHP

```php
<?php
class clsBlla {
```

```php
private $a;
public $b;
public function __construct(/* konstruktori I kl.  */  ){
$this->a=3;
$this->b=4;
}
function blla(){
echo $this->b;
echo '<br>'.$this->a;
}
}
// main (); programi hahha si ne c++
$instancaCls  /*instanca e kl.*/   =new clsBlla();
 $instancaCls-> blla();
 echo '<br>'. $instancaCls->b;
//echo '<br>'. $instancaCls->a;
//Fatal error: Cannot access private property clsBlla::$a in
C:\xampp\htdocs\AutoTrendi\prova\pointerat.php on line 50 PO SHIHET QKA OSHT HESAPI.
?>
```

# *Inheritance*

Once you have written a class, you can derive subclasses from it. This can save lots of painstaking code rewriting: you can take a class similar to the one you need to write, extend it to a subclass, and just modify the parts that are different. This is achieved using the extendsoperator.

In  Example 5-24, the class  Subscriberis declared a subclass of  Userby means of the extendsoperator.

Example 5-24. Inheriting and extending a class

```php
<?php
$object = new Subscriber;
$object->name = "Fred";
$object->password = "pword";
$object->phone = "012 345 6789";
$object->email = "fred@bloggs.com";
$object->display();
class User
{
public $name, $password;
```

```
function save_user()
{
echo "Save User code goes here";
}
}
class Subscriber extends User
{
public $phone, $email;
function display()
{
echo "Name: " . $this->name . "<br />";
echo "Pass: " . $this->password . "<br />";
echo "Phone: " . $this->phone . "<br />";
echo "Email: " . $this->email;
}
}
?>
```

The original Userclass has two properties, $nameand $password, and a method to save the current user to the database. Subscriberextends this class by adding an additional two properties, $phoneand $email, and includes a method of displaying the properties of the current object using the variable $this, which refers to the current values of the object being accessed. The output from this code is:

Name: Fred
Pass: pword
Phone: 012 345 6789
Email: fred@bloggs.com

So far we have come across the magic meth ods __construct, __destruct, and __toString, and have discussed them in detail. The remaining magic methods are __autoload, __call, __clone, __get, __set, __sleep, __wakeup, __unset, and __isset.

As you might expect, they only make sense
in the context of object-oriented programming (OOP).

---------------------------------------------------------------------------------------------------------------------

# *Passing by Reference*

In PHP, prefacing a variable name with the  &symbol tells the parser to pass a reference
to the variable's value, not the value itself. This concept can be hard to get your head
around, so let's go back to the matchbox metaphor from Chapter 3.
Imagine that, instead of taking a piece of paper out of a matchbox, reading it, copying
it to another piece of paper, putting the original back, and passing the copy to a function
(phew!), you simply attach a piece of thread to the original piece of paper and pass one
end of it to the function (see Figure 5-2).

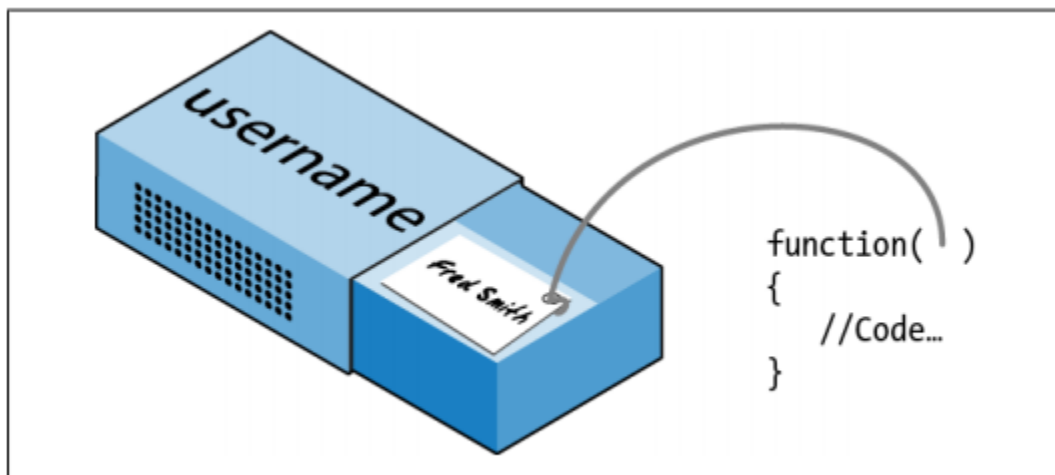

*Figure 5-2. Imagining a reference as a thread attached to a variable*

Figure 5-2. Imagining a reference as a thread attached to a variable
Now the function can follow the thread to find the data to be accessed. This avoids all
the overhead of creating a copy of the variable just for the function's use. What's more,
the function can now modify the variable's value.

```php
<?php
$a1 = "WILLIAM";
$a2 = "henry";
$a3 = "gatES";
echo $a1 . " " . $a2 . " " . $a3 . "<br />";
fix_names($a1, $a2, $a3);
echo $a1 . " " . $a2 . " " . $a3;
function fix_names(&$n1, &$n2, &$n3)
{
$n1 = ucfirst(strtolower($n1));
$n2 = ucfirst(strtolower($n2));
$n3 = ucfirst(strtolower($n3));
}
?>
```

Be careful when passing values by reference. If you need to keep the original values, make copies of your variables and then pass the copies by reference.

---------------------------------------------------------------------------------------------------------------------------

# SQL

**Server: localhost**
**Username: root**
**Password: NULL**

```php
<?php
$connect_error='ja kini qi nonen e keni bo naj error naj kun me 1 fjal ka kersit naj ka hahaha';
